Ambulatory: Retrieving Lost Documentation - HPI and ROS Components

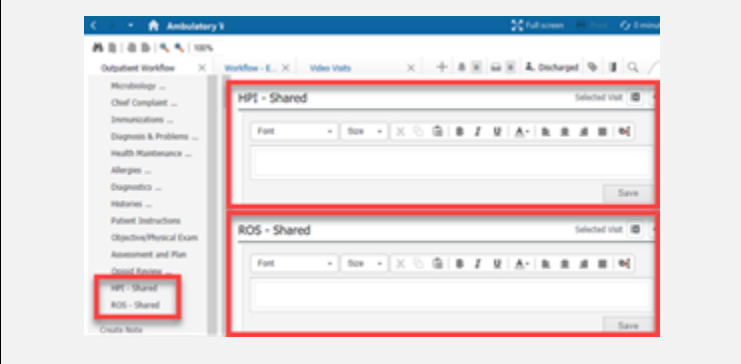

Retrieving Lost HPI/ROS Documentation Overview

Issue: Due to the recent enhancement of the HPI and ROS – shared components, previous documentation within these components was lost (pre-charted and/or saved documentation).

Resolution: Providers that had existing documentation within these components will be able to see it when the Office Visit Note is created. Providers will not see documentation within the components on their Workflow Page. The documentation will only display within the note and can be modified as desired.

Retrieving Lost HPI/ROS Documentation

- 1) In the patient’s chart, previously charted documentation within the HPI and ROS component **will not** display here.

- 2) Once the Provider creates their **Office Visit Note**, previously charted documentation **will display**.
 - a. If Providers started to redocument the HPI and/or ROS, they may see duplicate documentation under these sections within their note.
 - b. Providers can **modify** documentation within the note as needed before signing.
